Lesson 19a: Applying Surface Area and Volume to Aquariums

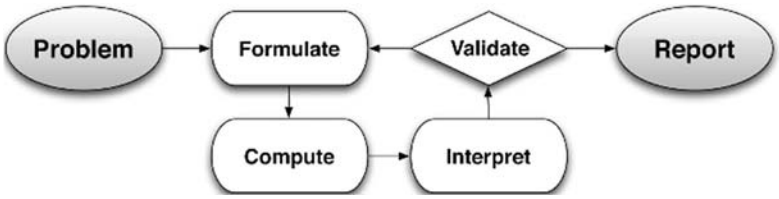
Student Outcomes

- Students apply the formulas for surface area and volume to determine missing dimensions of aquariums and water level.

Lesson Notes

The purpose of this lesson is to demonstrate an abridged version of the modeling cycle in preparation for shortened modeling cycles in Grades 7 and 8 and finally the complete modeling cycle in Grade 9. The modeling cycle is described and detailed in the New York State P–12 Common Core Standards for Mathematics, pages 61 and 62. Although the modeling cycle is addressed in detail in high school, the goal of instruction in Grades 6–8 is to prepare students for this kind of thinking. The graphic below is a brief summation of the modeling cycle in which students:

- Identify variables in a situation and select those that represent essential figures.
- Formulate a model by creating and selecting geometric, graphical, tabular, algebraic, or statistical representations between variables.
- Analyze and perform operations on these relationships to draw conclusions.
- Interpret results of the mathematics in terms of the original situation.
- Validate conclusions by comparing them with the situation, and then either improve the model or determine if it is acceptable.
- Report on the conclusions and the reasoning behind them.



This lesson affords students the opportunity to apply their knowledge of surface area and volume in the real-life context of aquariums. Students will also utilize their knowledge of rates and ratios, as well as apply arithmetic operations and their knowledge of expressions and equations from Module 4 to determine missing aquarium dimensions. Below is an outline of the CCSS addressed in this lesson.

Module	Other Related Modules	Standards
G6-M5: Area, Surface Area, and Volume Problems 6.EE.A.2c, 6.EE.B.5, 6.EE.B.6, 6.EE.B.7, 6.G.A.2, 6.G.A.4	M1: Ratios and Rates M2: Arithmetic Operations Including Dividing by a Fraction M4: Expressions and Equations	6.RP.A.1, 6.RP.A.2, 6.RP.A.3a, 6.RP.A.3b 6.NS.B.2, 6.NS.B.3, 6.NS.C.5 6.EE.A.2c, 6.EE.B.7, 6.EE.B.8

Students will model with mathematics, demonstrating CCSS Mathematical Practice 4 throughout this lesson. They will use proportional reasoning to plan, approximate, and execute problem solving and calculations in this contextual platform.

The activities in this lesson are based from the standard dimensions of a 10-gallon aquarium. Because real-life materials may not be accessible in all classrooms, problems are presented in two ways. Students will either use proportional reasoning to determine a course of action to calculate volume, surface area, and missing dimensions and/or students will experience a hands-on, tangible experience through optional exercises that are offered for those classrooms that have access to real-life materials. Teacher preparation will include finding aquariums with the dimensions noted in the lesson or adjusting the measurements throughout the lesson to match the aquariums actually used in the lesson. Teachers will need to prepare stations with liter measuring tools, gallon measuring tools, water, aquariums, and rulers. The exercises found in this teacher lesson are reproduced for the students in their student materials.

Classwork

Opening Exercise (2 minutes)

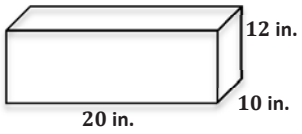
Display the following figure.

Most standard tanks and aquariums have a length of 20 inches, width of 10 inches, and height of 12 inches.

- Using the formula for volume, determine the volume of this aquarium in cubic inches.

Opening Exercise

Determine the volume of this aquarium.



$V = l \times w \times h; V = 20\ in. \times 10\ in. \times 12\ in.; V = 2{,}400\ in^3$

Example 1: Using Ratios and Unit Rate to Determine Volume (10 minutes)

- Below is a table of values that indicates the relationship between gallons of water and cubic inches.
- Use the table below to determine how many cubic inches are in one gallon of water, or more specifically, the unit rate of gallons/cubic inches.

Example 1: Using Ratios and Unit Rate to Determine Volume

For his environmental science project, Jamie is creating habitats for various wildlife including fish, aquatic turtles, and aquatic frogs. For each of these habitats, he will use a standard aquarium with length, width, and height dimensions measured in inches, identical to the aquarium mentioned in the Opening Exercise. To begin his project, Jamie will need to determine the volume, or cubic inches, of water that will fill the aquarium.

Use the table below to determine the unit rate of gallons/cubic inches.

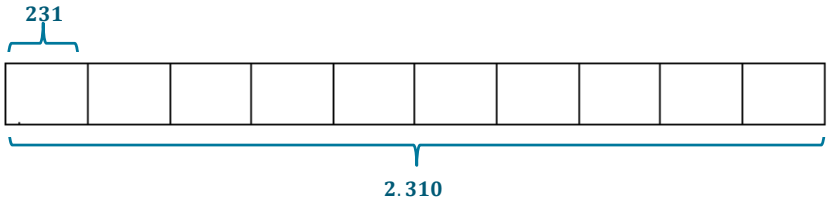
Gallons	Cubic Inches
1	231
2	462
3	693
4	924
5	1,155

There are 231 cubic inches for every one gallon of water. So, the unit rate is $\frac{cubic\ inches}{gallon}$.

- Since we determined that for every gallon of water, there are 231 cubic inches, determine how many cubic inches in the ten gallons of water that Jamie needs for the fish.
- How can we determine how many cubic inches are in ten gallons of water?
  - *We could use a tape diagram or a double number line, or we could find equivalent ratios.*
- Using either of these representations, determine the volume of the aquarium.

Determine the volume of the aquarium.

Answers will vary depending on student choice. An example of a tape diagram is below.



- We determined the volume of this tank is 2,310 in^3. This is not the same volume we calculated earlier in the opening exercise. Why do you think the volumes are different?
  - *Answers will vary but should include discussion that there needs to be room for a lid, the water level can't get all the way to the top so heaters and filters can fit in without the water spilling over, there needs to be room for the fish, etc.*
- Generally it is suggested that the highest level of water in this tank should be approximately 11.55 inches. Calculate the volume of the aquarium using this new dimension.
  - $V = l \times w \times h; V = 20\ in. \times 10\ in. \times 11.55\ in.; V = 2{,}310\ in^3.$
- What do you notice about this volume?
  - *This volume is the same as the volume we determined when we found the volume using ratio and unit rates.*
- Let's use the dimensions 20 in. × 10 in. × 11.55 in. for our exploration.

Optional Exercise 1

- We have determined that the volume for the ten-gallon aquarium with dimensions 20 in. $\times$ 10 in. $\times$ 11.55 in. is $2{,}310$ in^3.
- Suppose Jamie needs to fill the aquarium to the top in order to prepare the tank for fish. According to our calculations, if Jamie pours ten gallons into the tank, the height of the water will be approximately 11.55 in.
- Let's test it. Begin pouring water into the aquarium one gallon at a time. Be sure to keep track of the number of gallons. Use a tally system.

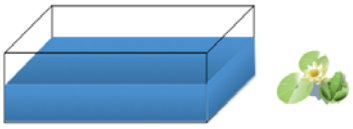
Tally the Number of Gallons	Number of Gallons
𝍸	10

- Measure the height of the water with your ruler.
- What did you find about our height estimation? Our estimation was correct. The height is approximately 11.55 in.

Exercise 1 (10 minutes)

- Next, suppose Jamie needs to prepare another aquarium for aquatic frogs. He contacted the local pet store, and the employee recommended that Jamie only partially fill the tank in order for the frogs to have room to jump from the water to a lily pad or designated resting place. The employee suggested that the tank hold 7 gallons of water. Considering the length and the width of the tank remain the same (20 in. $\times$ 10 in.), use what you know about volume to determine the height of the water that is appropriate for the frogs in the tank.
- To determine the missing dimension of height, we need the volume formula $V = l \cdot w \cdot h$.

Exercise 1



a. Determine the volume of the tank when filled with 7 gallons of water.

$231\frac{cubic\ inches}{gallon} \cdot 7\ gallons = 1,617\ in^3$. *The volume for seven gallons of water is* $1,617\ in^3$.

b. Work with your group to determine the height of the water when Jamie places seven gallons of water in the aquarium.

$$1,617\ in^3 = 20\ in.(10\ in.)h$$
$$\frac{1,617 in^3}{200\ in^2} = \frac{200\ in^2}{200\ in^2}h$$
$$8.085\ in. = h$$

The tank should have a water height of 8.085 *inches.*

Optional Exercise 2

- Let's test it. Begin pouring water into the aquarium one gallon at a time.
- Be sure to keep track of the number of gallons. Use a tally system.

Or, have students mark the height of the water using a wax marker or a dry erase marker on the outside of the tank after each gallon is poured. Then, students measure the intervals (distance between the marks). Students will notice that the intervals are equal.

- Test the height at 7 gallons, and record the height measurement.
  -

Tally the Number of Gallons	Number of Gallons
𝍸 ||	7

- What did you find about our estimation? Our estimation was correct. The height is about 8 inches.

Exercise 2 (5 minutes)

- According to the local pet store, turtles need very little water in an aquarium. The suggested amount of gallons of water in the aquarium for a turtle is 3 gallons. Determine the height of the water in another same sized aquarium that is housing a turtle when the amount of water Jamie pours into the tank is 3 gallons.
- Describe how you would estimate the height level?
  - *First, determine the volume of the water. Then, to determine the missing dimension of height, we need the volume formula $V = l \cdot w \cdot h$.*

Exercise 2

a. Use the table from Example 1 to determine the volume of the aquarium when Jamie pours 3 gallons into the tank.

The volume of the tank is $693\ in^3$.

b. Use the volume formula to determine the missing height dimension.

$$693\ in^3 = 20\ in.(10\ in.)h$$
$$\frac{693\ in^3}{200\ in^2} = \frac{200\ in^2}{200\ in^2}h$$
$$3.465\ in. = h$$

The tank should have a water height of $3.465\ in.$

Optional Exercise 3

- Let's test it. Begin with pouring water into the aquarium. Be sure to keep track of the number of gallons poured.
- Test the height at 3 gallons, and record the height measurement.
  -

Tally the Number of Gallons	Number of Gallons
|||	3

- What did you find about our estimation? Our estimation was correct. The height is about $3\frac{1}{2}$ inches.

Exercise 3 (5 minutes)

- Let's say that when Jamie sets up these same sized aquariums at home he doesn't have any tools that measure gallons. What he does have at home is a few leftover one-liter soft drink bottles. How could Jamie calculate the volume of the aquarium?
  - *Answers will vary but should include that gallons need to be converted to liters.*
- Using the table of values, determine the unit rate for liters to gallons.
- What is the unit rate?
  - *The unit rate is* $3.785\ \frac{liters}{gallon}$.
- What does this mean?
  - *Answers will vary. For every gallon of water, there are* 3.785 *liters of water.*
- If this conversion is accurate, determine the number of liters Jamie will need to fill a ten-gallon tank.
  - $3.785\ \frac{liters}{gallon} \times\ 10\ gallons = 37.85\ liters$
- It is not advantageous to combine liters and inches. Liters and centimeters are both in the metric system of measurement. The ratio of the number of centimeters to the number of inches is $2.54:1$. What does this mean?
  - *Answers will vary. For every inch, there are* 2.54 *centimeters.*
- What is the unit rate?
  - *The unit rate is* $2.54\ \frac{centimeters}{inch}$.
- Use the conversion to determine the length, the width, and the height of the aquariums in centimeters.

Exercise 3

a. Using the table of values below, determine the unit rate of liters to gallon.

Gallons	Liters
1	3.785
2	7.57
4	15.14

The unit rate is $3.785\ \frac{liters}{gallon}$.

b. Using this conversion, determine the number of liters you will need to fill the ten-gallon tank.

$3.785 \frac{liters}{gallon} \times 10\ gallons = 37.85\ liters$

c. The ratio of the number of centimeters to the number of inches is $2.54 : 1$. What is the unit rate?

$2.54 \frac{centimeters}{inch}$

d. Using this information, complete the table to convert the heights of the water in inches to heights of the water in centimeters Jamie will need for his project at home.

Height in Inches	Convert to Centimeters	Height in Centimeters
1	$2.54 \frac{centimeters}{inch} \times 1\ inch$	2.54
3.465	$2.54 \frac{centimeters}{inch} \times 3.465\ inches$	8.8011
8.085	$2.54 \frac{centimeters}{inch} \times 8.085\ inches$	20.5359
11.55	$2.54 \frac{centimeters}{inch} \times 11.55\ inches$	29.337

Exercise 4 (5 minutes)

- Jamie had the tanks he used at home shipped from the manufacturer. Typically, the manufacturer sends aquariums already assembled; however, they use plastic film to cover the glass in order to protect it during shipping.
- Determine the amount of plastic film the manufacturer uses to cover the aquarium faces. Draw a sketch of the aquarium to assist in your calculations. Remember that the actual height of the aquarium is 12 inches.

Exercise 4

a. Determine the amount of plastic film the manufacturer uses to cover the aquarium faces. Draw a sketch of the aquarium to assist in your calculations. Remember that the actual height of the aquarium is 12 inches.

$SA = (2lw) + (2lh) + (2wh)$

$SA = (2 \cdot 20\ in. \cdot 10\ in.) + (2 \cdot 20\ in. \cdot 12\ in.) + (2 \cdot 10\ in. \cdot 12\ in.)$

$SA = 400\ in^2 + 480\ in^2 + 240\ in^2$

$SA = 1,120\ in^2$

- We do not include the measurement of the top of the aquarium since it is open without glass. It does not need to be covered with film.

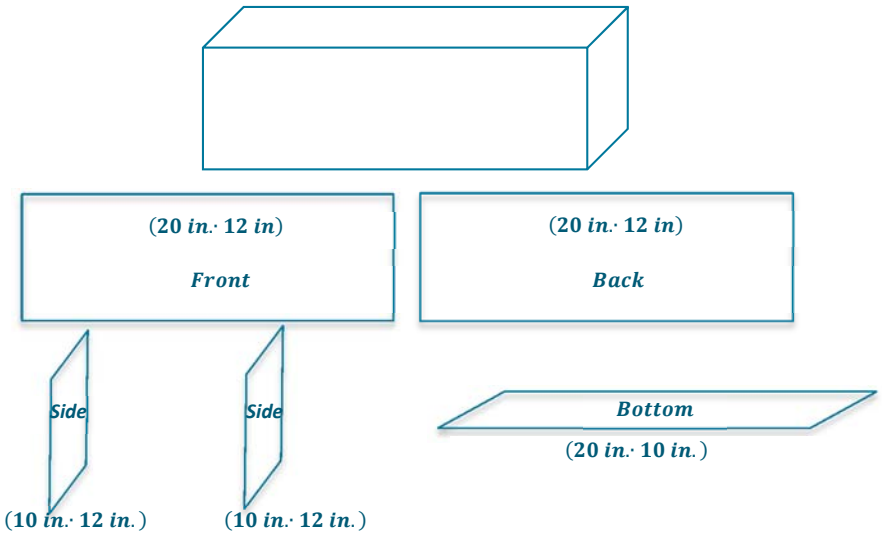
b. We do not include the measurement of the top of the aquarium since it is open without glass and does not need to be covered with film. Determine the area of the top of the aquarium, and find the amount of film the manufacturer will use to cover only the sides, front, back, and bottom.

Area of the top of the aquarium $= l \cdot w$

Area of the top of the aquarium $= 20\ in. \cdot 10\ in.$

Area of the top of the aquarium $= 200\ in^2$

SA of aquarium without the top $= 1,120\ in^2 - 200\ in^2 = 920\ in^2$



c. Since Jamie will need three aquariums, determine the total surface area of the three aquariums.

$920\ in^2 + 920\ in^2 + 920\ in^2 = 2,760\ in^2$ *or* $3 \cdot 920\ in^2 = 2,760\ in^2$

Challenge Exercises (5 minutes)

1. The company that ships the aquariums charges $\$300$ per aquarium. Jamie is considering building the aquariums at home and buying the parts from a different company that sells glass for $\$0.11$ per square inch. Which option, buying the aquariums already built from the first company or buying the glass and building at home, is a better deal?

   Sample Solution:

   $2{,}760\ in^2 \cdot 0.11 \frac{dollars}{in^2} = 303.6\ dollars$ *or* $\$303.60$. *It would be a better deal for Jamie to purchase the aquarium from the company because* $\$303.60 > \$300$.

2. If Jamie wanted to increase the length of the aquarium by 20%, how would that affect the surface area? How would it affect the volume of water the tank could contain?

   Sample Solution:

   Since the length is 20 *inches,* $20\ in. \cdot 0.20 = 4$ *additional inches. The new length would be* $20\ in. + 4\ in. = 24\ in.$

   $SA = 2(lw) + 2(lh) + 2(wh)$

   $SA = 2(24\ in. \cdot 12\ in.) + 2(24\ in. \cdot 10\ in.) + 2(10\ in. \cdot 12\ in.)$

   $SA = 576\ in^2 + 480\ in^2 + 240\ in^2$

   $SA = 1{,}296\ in^2$

   The new surface are of $1{,}296\ in^2$ *is* $176\ in^2$ *more than the original surface area of* $1{,}120\ in^2$.

   $V = l \cdot w \cdot h$; $V = 24\ in. \cdot 12\ in. \cdot 10\ in. = 2{,}880\ in^3$, *which is* $480\ in^3$ *more than the original volume of* $2{,}400\ in^3$.

Closing/Exit Ticket (3 minutes)

What did you learn today? Describe at least one situation in real life that would draw on the skills you used today.

Answers will vary.

Name _____ Date_____

Lesson 19a: Applying Surface Area and Volume to Aquariums

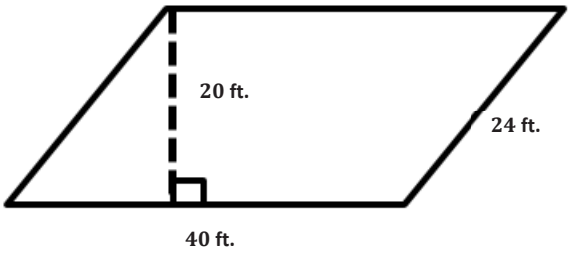
Exit Ticket

What did you learn today? Describe at least one situation in real life that would draw on the skills you used today.

Problem Set Sample Solutions

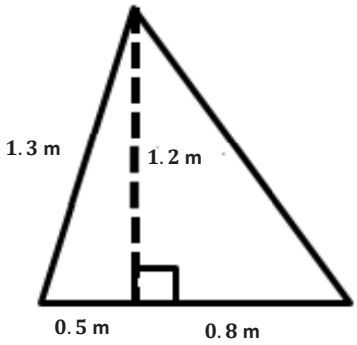
This Problem Set is a culmination of skills learned in this module. Note that the figures are not drawn to scale.

1. Calculate the area of the figure below.



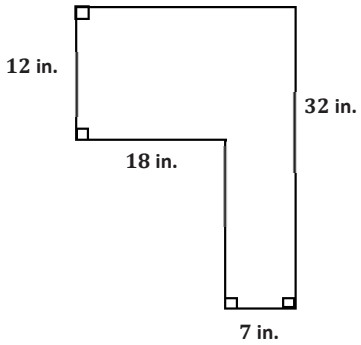
$$A = bh$$
$$A = (40\ ft.)(20\ ft.)$$
$$A = 800\ ft^2$$

2. Calculate the area of the figure below.



$$A = \frac{1}{2}bh$$
$$A = \frac{1}{2}(1.3\ m)(1.2\ m)$$
$$A = 0.78\ m^2$$

3. Calculate the area of the figure below.



Area of top rectangle

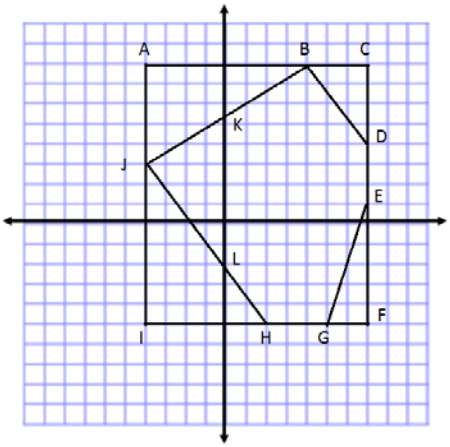
$$A = lw$$
$$A = (25\ in.)(12\ in.)$$
$$A = 300\ in^2$$

Area of bottom rectangle

$$A = lw$$
$$A = (7\ in.)(20\ in.)$$
$$A = 140\ in^2$$

$$Total\ Area = 300\ in^2 + 140\ in^2 = 440\ in^2$$

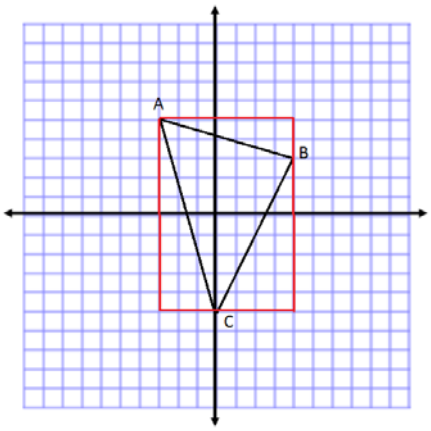
4. Complete the table using the diagram on the coordinate plane.



Line Segment	Point	Point	Distance	Proof
$\overline{AB}$	$(-4, 8)$	$(4, 8)$	8	$\lvert -4\rvert + \lvert 4\rvert = 8$
$\overline{CE}$	$(7, 8)$	$(7, 1)$	7	$\lvert 8\rvert - \lvert 1\rvert = 7$
$\overline{GI}$	$(5, -5)$	$(-4, -5)$	9	$\lvert 5\rvert + \lvert -4\rvert = 9$
$\overline{HI}$	$(2, -5)$	$(-4, -5)$	6	$\lvert 2\rvert + \lvert -4\rvert = 6$
$\overline{IJ}$	$(-4, -5)$	$(-4, 3)$	8	$\lvert -5\rvert + \lvert 3\rvert = 8$
$\overline{AI}$	$(-4, 8)$	$(-4, -5)$	13	$\lvert 8\rvert + \lvert -5\rvert = 13$
$\overline{AJ}$	$(-4, 8)$	$(-4, 3)$	5	$\lvert 8\rvert - \lvert 3\rvert = 5$

5. Plot the points for each shape. Then determine the area of the polygon.

$A(-3, 5), B(4, 3), C(0, -5)$



$$Area = lw$$
$$Area = (7\ units)(10\ units)$$
$$Area = 70\ units^2$$

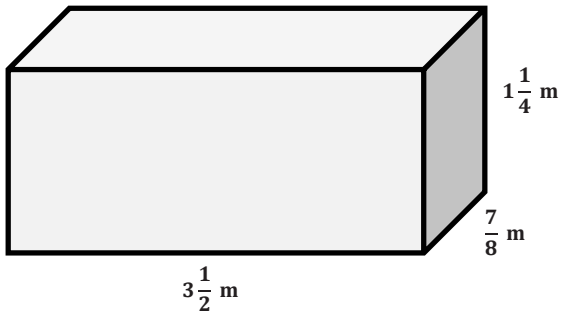
$$Area\ on\ left = \frac{1}{2}bh$$
$$Area = \frac{1}{2}(3\ units)(10\ units)$$
$$Area = 15\ units^2$$

$$Area\ on\ top = \frac{1}{2}bh$$
$$Area = \frac{1}{2}(7\ units)(2\ units)$$
$$Area = 7\ units^2$$

$$Area\ on\ right = \frac{1}{2}bh$$
$$Area = \frac{1}{2}(4\ units)(8\ units)$$
$$Area = 16\ units^2$$

$$Final\ Area = 70\ units^2 - 15\ units^2 - 7\ units^2 - 16\ units^2$$
$$Final\ Area = 32\ units^2$$

6. **Determine the volume of the figure.**



$V = l\,w\,h$

$V = \left(3\frac{1}{2}\ m\right)\left(\frac{7}{8}m\right)\left(1\frac{1}{4}\ m\right)$

$V = \frac{245}{64}\ m^3$

$V = 3\frac{53}{64}\ m^3$

7. **Give at least three more expressions that could be used to determine the volume of figure in Problem 6.**

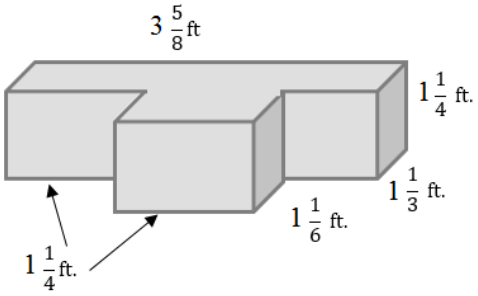
Answers will vary. Some examples include:

$$\left(\frac{35}{32}\ m^2\right)\left(3\frac{1}{2}m\right)$$

$$\left(1\frac{1}{4}m\right)\left(\frac{7}{8}m\right)\left(3\frac{1}{2}m\right)$$

$$\left(\frac{49}{16}\ m^2\right)\left(1\frac{1}{4}\ m\right)$$

8. **Determine the volume of the irregular figure.**



$V = l\,w\,h$

$V = \left(3\frac{5}{8}ft.\right)\left(1\frac{1}{3}ft.\right)\left(1\frac{1}{4}ft.\right)$

$V = \frac{580}{96}\ ft^3$

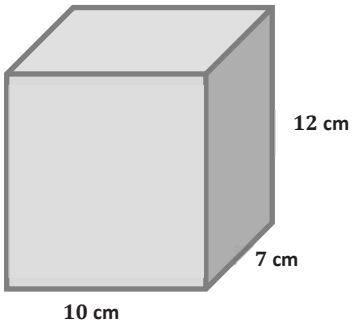
$V = l\,w\,h$

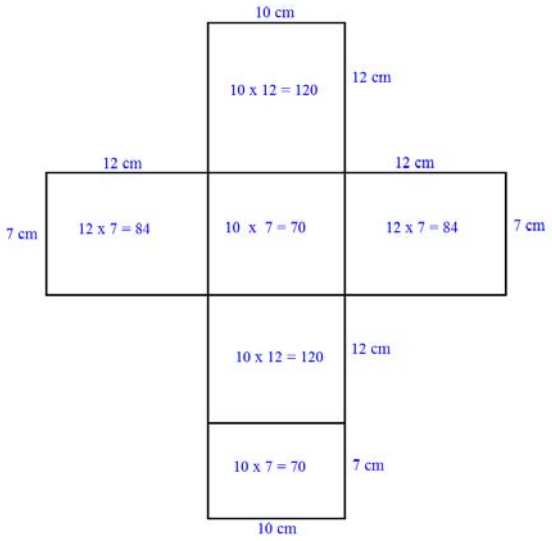
$V = \left(1\frac{1}{4}ft.\right)\left(1\frac{1}{6}\ ft.\right)\left(1\frac{1}{4}ft.\right)$

$V = \frac{175}{96}\ ft.^3$

$$Total\ volume = \frac{580}{96}\ ft^3 + \frac{175}{96}ft^3 = \frac{755}{96}ft^3 = 7\frac{83}{96}\ ft^3$$

9. Draw and label a net for the following figure. Then use the net to determine the surface area of the figure.





$$SA = 120\ cm^2 + 84\ cm^2 + 70\ cm^2 + 84\ cm^2 + 120\ cm^2 + 70\ cm^2 = 548\ cm^2$$

10. Determine the surface area of the figure in Problem 9 using the formula $SA = 2lw + 2lh + 2wh$. Then compare your answer to the solution in Problem 9.

$$SA = 2lw + 2lh + 2wh$$
$$SA = 2(10\ cm)(7\ cm) + 2(10\ cm)(12\ cm) + 2(7\ cm)(12\ cm)$$
$$SA = 140\ cm^2 + 240\ cm^2 + 168\ cm^2$$
$$SA = 548\ cm^2$$

The answer in Problem 10 is the same as in Problem 9. The formula finds the areas of each face and adds them together, like we did with the net.

11. A parallelogram has a base of 4.5 cm and an area of 9.495 cm^2. Tania wrote the equation $4.5x = 9.495$ to represent this situation.

a. Explain what x represents in the equation.

x represents the height of the parallelogram.

b. Solve the equation for x.

$$\frac{4.5x}{4.5} = \frac{9.495}{4.5}$$
$$x = 2.11\ cm$$

12. Triangle A has an area equal to one-third the area of Triangle B. Triangle A has an area of $3\frac{1}{2}$ square meters.

a. Gerard wrote the equation $\frac{B}{3} = 3\frac{1}{2}$. Explain what B represents in the equation.

B represents the area of Triangle B in square meters.

b. Determine the area of Triangle B.

$$\frac{B}{3} \cdot 3 = 3\frac{1}{2} \cdot 3$$

$B = 10\frac{1}{2}$ *square meters*
