

Lesson 10: Distance, Perimeter, and Area in the Real World

Student Outcomes

- Students determine distance, perimeter, and area in real-world contexts.

Lesson Notes

This lesson is similar to Lesson 6 from this module. The teacher can determine ahead of time whether to do the exploration in the classroom or venture out into hallways or some other location. The measuring tools, units, and degree of precision to be used in this activity should be chosen in a manner that best meets the needs of the students. For large distances, a long measuring tape or trundle wheel can be used. For very small objects, a millimeter ruler would be more appropriate.

The critical understanding for students is that area involves covering, while perimeter involves surrounding. Since plane objects have both area and perimeter, the distinction between the two concepts must be made.

When choosing objects to be measured, look for composite objects that require more than just measuring length and width. Avoid curved edges as students will not be able to find area. When possible, choose objects that explicitly lend themselves to both area and perimeter. Such objects could include a frame or mat around a picture, wood trim around the top of a table, piping around a dinner napkin, or baseboard molding along walls. Some of the objects that were chosen for Lesson 6 of this Module can also be used.

It is appropriate for students to use a calculator for this lesson.

Classwork

Opening Exercise (5 minutes)

Opening Exercise

- Find the area and perimeter of this rectangle:

$$A = bh = 9 \text{ cm} \times 5 \text{ cm} = 45 \text{ cm}^2$$

$$P = 9 \text{ cm} + 9 \text{ cm} + 5 \text{ cm} + 5 \text{ cm} = 28 \text{ cm}$$

Scaffolding:

There is great flexibility in this lesson, so it can be tailored to the needs of the class and can be easily individualized for both struggling and advanced learners.

2. Find the width of this rectangle. The area is 1.2 m^2 , and the length is 1.5 m .

$$l = 1.5 \text{ m}$$

$$A = l \times w$$

$$1.2 \text{ m}^2 = 1.5 \text{ m} \times w$$

$$\frac{1.2 \text{ m}^2}{1.5 \text{ m}} = w = 0.8 \text{ m}$$

Discussion (5 minutes)

- How many dimensions does the rectangle have, and what are they?
 - *Two dimensions: length and width.*
- What units are used to express area?
 - *Square units, such as square centimeters as we had here.*
- What superscript is used to denote square units?
 - *A "2", for two dimensions.*
- What does the prefix *peri-* mean?
 - *Around.*
- Are there any other words that use this prefix?
 - *Periscope (seeing around), periodontal (surrounding a tooth), pericardium (the sac around the heart), period (a portion of time that is limited and determined by some recurring phenomenon, as by the completion of a revolution of the earth or moon), etc.*
- How can focusing on the meaning of the word help you remember the difference between area and perimeter?
 - *Peri- means around; -meter means measure. Perimeter is the measure of the distance around an object. Area is the measure of the surface of an object and has two dimensions.*
- How many dimensions do the line segments around the rectangle have?
 - *One. Lines segments only have length.*
- What units are used to express perimeter?
 - *Linear units.*
- We don't typically write linear units with an exponent because the exponent is 1.

Scaffolding:

The term *dimensions* may be new to ELL students and as such, may need to be taught and rehearsed. Similarly, the word *superscript* may be new for ELL students and should be taught or reviewed.

Exploratory Challenge

Example 1 (5 minutes): Student Desks or Tables

Distribute measuring tools. Explain the units that will be used and level of precision expected.

Example 1: Student Desks or Tables

1. Measure the dimensions of your desktop.
2. How do you find the area of the desktop?
3. How do you find the perimeter?
4. Record these on your paper in the appropriate column below.

Scaffolding:

Consider asking some students to measure to the nearest inch, others to the nearest half-inch, and others to the nearest quarter-inch, depending on ability. Compare these.

- Let's do an example before starting out on this investigation. Measure the dimensions of your desktop (or table top, etc.).
 - *Dimensions will vary.*
- How do you find the area of the surface?
 - *Multiply the length by the width.*
- How do you find the perimeter?
 - *Any of three ways: Add the length and width (to find the semi-perimeter), and then double the sum; double the length, double the width, and add those two products; or add the length, length, width, and width.*
- Record these on your paper in the appropriate column.

Exercise 1 (15 minutes)

Exercise 1

Estimate and predict the area and perimeter of each object. Then measure each object and calculate both the area and perimeter of each.

Answers are determined by the teacher when objects are chosen. Consider using examples like decorating a bulletin board: bulletin board trim (perimeter), paper for bulletin board (area).

Object or item to be measured	Measurement units	Precision (measure to the nearest)	Area Prediction (square units)	Area (square units) Write the expression and evaluate it	Perimeter Prediction (linear units)	Perimeter (linear units)
Ex: door	feet	half foot		$6\frac{1}{2} ft. \times 3\frac{1}{2} ft. = 22\frac{3}{4} ft.^2$		$2(3\frac{1}{2} ft. + 6\frac{1}{2} ft.) = 20 ft.$
desktop						

Exercise 2 (10 minutes) (Optional)

If desired, send some students to measure other real-world objects found around the school. Set measurement units and precision parameters in advance. The teacher should measure these objects in advance of the activity and calculate the corresponding perimeters and areas. Measuring the school building from the outside could be a whole group activity or could be assigned as an extra credit opportunity.

Exercise 2				
Object or item to be measured	Measurement units	Precision (measure to the nearest)	Area (square units)	Perimeter (linear units)
Ex: door	feet	half foot	$6\frac{1}{2} ft \times 3\frac{1}{2} ft = 22\frac{3}{4} ft^2$	$2\left(3\frac{1}{2} ft + 6\frac{1}{2} ft\right) = 20 ft.$

Closing (2 minutes)

- What are some professions that use area and perimeter regularly?
 - *Surveyors, garment manufacturers, packaging engineers, cabinet makers, carpenters.*
- Can you think of any circumstances where you or someone you know has or might have to calculate perimeter and area?
 - *Answers will vary. Encourage a large quantity of responses.*
- Would you like to work in an occupation that requires measuring and calculating as part of the duties?
 - *Answers will vary.*

Exit Ticket (2 minutes)

Name _____

Date _____

Lesson 10: Distance, Perimeter, and Area in the Real World

Exit Ticket

- The local school is building a new playground. This plan shows the part of the playground that needs to be framed with wood for the swing set. The unit of measure is feet. Determine the number of feet of wood that will be needed to frame the area.

- The school will fill the area with wood mulch for safety. Determine the number of square feet that need to be covered by the mulch.

Exit Ticket Sample Solutions

- The local school is building a new playground. This plan shows the part of the playground that needs to be framed with wood for the swing set. The unit of measure is feet. Determine the number of feet of wood that will be needed to frame the area.

Perimeter: $10\text{ ft.} + 6\text{ ft.} + 6\text{ ft.} + 3\text{ ft.} + 3\text{ ft.} + 8\text{ ft.} + 8\text{ ft.} + 4\text{ ft.} = 48\text{ ft.}$

- The school will fill the area with wood mulch for safety. Determine the number of square feet that need to be covered by the mulch.

$A = bh = (6\text{ ft.} \times 10\text{ ft.}) = 60\text{ ft}^2$

$A = bh = (8\text{ ft.} \times 4\text{ ft.}) = 32\text{ ft}^2$

$A = 60\text{ ft}^2 + 32\text{ ft}^2 = 92\text{ ft}^2$

Problem Set Sample Solutions

Note: When columns in a table are labeled with units, students need only enter numerical data in the cells of the table and not include the units each time.

- How is the length of the side of a square related to its area and perimeter? The diagram below shows the first four squares stacked on each other.

a. Complete this chart calculating area and perimeter for each square.

Side length in feet	Expression showing the area	Area in square feet	Expression showing the perimeter	Perimeter in feet
1	1×1	1	1×4	4
2		4		8
3		9		12
4		16		16
5		25		20
6		36		24
7		49		28
8		64		32
9		81		36
10		100		40
n		n^2		$4n$

b. In a square, which numerical value is greater, the area or the perimeter?

It depends. For side length < 4, perimeter is greater. For side length > 4, area is greater.

c. When is a square's area (in square units) equal to its perimeter (in units)?

When the side length is 4.

d. Why is this true?

$n^2 = 4n$ only when $n = 4$.

2. This drawing shows a school pool. The walkway around the pool needs special non-skid strips installed but only at the edge of the pool and the outer edges of the walkway.

a. Find the length of non-skid strips that are needed for the job.

$50\text{ m} + 50\text{ m} + 15\text{ m} + 15\text{ m} + 90\text{ m} + 90\text{ m} + 25\text{ m} + 25\text{ m} = 360\text{ m}$

b. The non-skid strips are sold only in rolls of 50 m. How many rolls need to be purchased for the job?

$360\text{ m} \div 50 \frac{\text{m}}{\text{roll}} = 7.2\text{ rolls}$; therefore, 8 rolls will need to be purchased.

3. A homeowner called in a painter to paint the walls and ceiling of one bedroom. His bedroom is 18 ft. long, 12 ft. wide, and 8 ft. high. The room has two doors, each 3 ft. by 7 ft. and three windows each 3 ft. by 5 ft. The doors and windows do not have to be painted. A gallon of paint can cover 300 ft². A hired painter claims he will need 4 gallons. Show that his estimate is too high.

Area of 2 long walls: $2(18 \text{ ft.} \times 8 \text{ ft.}) = 288 \text{ ft}^2$

Area of 2 short walls: $2(12 \text{ ft.} \times 8 \text{ ft.}) = 192 \text{ ft}^2$

Area of ceiling: $18 \text{ ft.} \times 12 \text{ ft.} = 216 \text{ ft}^2$

Area of 2 doors: $2(3 \text{ ft.} \times 7 \text{ ft.}) = 42 \text{ ft}^2$

Area of 3 windows $3(3 \text{ ft.} \times 5 \text{ ft.}) = 45 \text{ ft}^2$

Area to be painted: $(288 \text{ ft}^2 + 192 \text{ ft}^2 + 216 \text{ ft}^2) - (42 \text{ ft}^2 + 45 \text{ ft}^2) = 609 \text{ ft}^2$

Gallons of paint needed: $609 \div 300 = 2.03$. *The painter will need a little more than 2 gallons.*

The painter's estimate for how much paint is necessary was too high.

4. Theresa won a gardening contest and was awarded a roll of deer-proof fencing. The fence is 36 yards long. She and her husband, John, discuss how to best use the fencing to make a rectangular garden. They agree that they should only use whole numbers of feet for the length and width of the garden.

- a. What are the possible dimensions of the garden?

<i>Length in Feet</i>	<i>Width in Feet</i>
17	1
16	2
15	3
14	4
13	5
12	6
11	7
10	8
9	9

- b. Which plan yields the maximum area for the garden? Which plan yields the minimum area?

<i>Length in feet</i>	<i>Width in feet</i>	<i>Area in square feet</i>
17	1	17
16	2	32
15	3	45
14	4	56
13	5	65
12	6	72
11	7	77
10	8	80
9	9	81

The 9 foot by 9 foot garden would have the maximum area (81 ft²), while the 17 foot by 1 foot garden would have only 17 ft² of garden space.

5. Write and then solve the equation to find the missing value below.

$$A = l \times w$$

$$1.82 \text{ m}^2 = 1.4 \text{ m} \times w$$

$$\frac{1.82 \text{ m}^2}{1.4 \text{ m}} = w$$

$$1.3 \text{ m} = w$$

6. Challenge Problem: This is a drawing of the flag of the Republic of the Congo. The area of this flag is $3\frac{3}{4} \text{ ft}^2$.
- a. Using the area formula, tell how you would determine the value of the base.

Since $A = bh$, $A \div h = b$

$$\frac{3\frac{3}{4} \text{ ft}^2}{1\frac{1}{2} \text{ ft}} = 2\frac{1}{2} \text{ ft.}$$

- b. Using what you found in part (a), determine the missing value of the base.

$$2\frac{1}{2} \text{ ft.} = 1\frac{1}{2} \text{ ft.} + x$$

$$1 \text{ ft.} = x$$
