Lesson 6: The Distance Between Two Rational Numbers

Student Outcomes

- Students justify the distance formula for rational numbers on a number line: If $p$ and $q$ are rational numbers on a number line, then the distance between $p$ and $q$ is $|p - q|$.
- Students know the definition of subtraction in terms of addition (i.e., $a - b = c$ means that $b + c = a$) and use the definition of subtraction to justify the distance formula.
- Students solve word problems involving changes in distance or temperature.

Classwork

Exercise 1 (4 minutes)

Students are in groups of 2; one person is Person A, and the other is Person B. Using a number line, each person independently counts the number of units that make up the distance between the two numbers listed in his assigned column.

<table>
<thead>
<tr>
<th>Exercise 1</th>
<th>Use the number line to answer each of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Person A</td>
<td>Person B</td>
</tr>
<tr>
<td>What is the distance between 4 and 5? 9</td>
<td>What is the distance between 5 and 4? 9</td>
</tr>
<tr>
<td>What is the distance between 5 and 3? 2</td>
<td>What is the distance between 3 and 5? 2</td>
</tr>
<tr>
<td>What is the distance between 7 and 1? 8</td>
<td>What is the distance between 1 and ?? 8</td>
</tr>
</tbody>
</table>

After 3 minutes, partners share their answers and determine that their distances are the same because their endpoints are the same.

(Note: A common mistake is that students count the first number as one. Another common mistake is that students describe the distance as negative.)

Scaffolding:

- Students may find it easier to see the distance if they use a highlighter on the number line and highlight the distance between the two numbers.
Discussion (5 minutes)

Follow-up Discussion

- What was the distance between \( \text{and } \) ?
- What was the distance between \( \text{and } \) ?
- Were you and your partner’s answers the same for the second and third problems as well?
  - Yes
- Why did you both get the same answers for all three problems?
  - Because the endpoints were the same, so the distance in between them is the same.
- Take a minute to share with your partner a destination that you or your family usually travel to — for example, a relative’s house or the location of an activity you attend each week. Assuming you take the same route to and from the location, what is the approximate distance in miles that you travel each way?
  - Answers will vary, but students should recognize that the distance is the same to and from the location and should state the same number of miles whether traveling from home to the location, or from the location back home.
- In life, at any given moment, will we always be able to use a number line to find the distance between two rational numbers? Is it the most efficient way to calculate distance between the two points?
  - No
- What represents the distance between a number and zero on the number line?
  - Absolute Value
- If the distance between \( \text{and } \) can be calculated using \( \text{or } \), do you think we might be able to calculate the distance between \( \text{and } \) using absolute value? Take a minute to see if it works.
  - Yes; \( \text{and } \), which is the answer we found in Exercise 1.
- Will this work for the other two distances we looked at in Exercise 1? Take a minute to test it out.
  - Yes

Exercise 2 (5 minutes)

Students now work independently using the formula to find the distance between each of the two given endpoints. They should verify their answer by using a number line model.

Scaffolding:
- Consider having students determine the distance on the number line first, and then use the formula to verify (rather than the other way around).
Lesson 6: The Distance Between Two Rational Numbers

b. What is the distance between and \( -7 \)?

c. What is the distance between and ?

Example 1 (3 minutes): Formula for the Distance Between Two Rational Numbers

If \( a \) and \( b \) are rational numbers on a number line, then the distance between \( a \) and \( b \) is \( |a - b| \). It does not matter which endpoint we call \( a \) or \( b \). Distance is always positive.

Example 1: Formula for the Distance Between Two Rational Numbers

Find the distance between \(-3\) and \(2\).

The steps are:
1. Start on \(-3\).
2. Count the number of units from \(-3\) to \(2\).

Using a formula:

\[
\text{Distance} = |a - b| = |\text{number of units}|
\]

For two rational numbers \(a\) and \(b\), the distance between \(a\) and \(b\) is \(|a - b|\).
Example 2 (5 minutes): Change in Elevation vs. Distance

Whole-group instruction; students record examples in their student materials.

Example 2: Change in Elevation vs. Distance

Distance is positive. Change in elevation or temperature may be positive or negative depending on whether it is increasing or decreasing (going up or down).

1. A hiker starts hiking at the beginning of a trail at a point which is \( \text{feet} \) below sea level. He hikes to a location on the trail that is \( \text{feet} \) above sea level and stops for lunch.
   a. What is the vertical distance between \( \text{feet} \) below sea level and \( \text{feet} \) above sea level?

   \( \text{feet} \).
   
   b. How should we interpret \( 780 \) feet in the context of this problem?

   The hiker hiked \( \text{feet} \) from a point below sea level to a point above sea level.

2. After lunch, the hiker hiked back down the trail from the point of elevation, which is \( 580 \) feet above sea level, to the beginning of the trail which is \( 200 \) feet below sea level.
   a. What is the vertical distance between \( 580 \) feet above sea level and \( 200 \) feet below sea level?

   \( \text{feet} \).
   
   b. What is the change in elevation?

   \( \text{feet} \).
Exercise 3 (4 minutes)

Students work with a partner to come up with a solution to the following. They use the distance formula to verify their answers but may first need to use a number line model to arrive at the two numbers for their solutions.

Note: A student may be tempted to use zero as one of the numbers; if that is the case, ask the student if zero is negative or positive.

Exercise 3

The distance between a negative number and a positive number is \( - \). What are the numbers?

Answers will vary; a possible solution is \( - \) and \( - \). – units

Consider the different solutions students came up with, and notice that for each case if we take the absolute value of each of the endpoints, their sum is \( - \). Is that the case for Exercises 2 (a)–(c)? Why not?

No, that is not always the case. If you have a positive number and a negative number as endpoints, they are separated by zero. And since absolute value is a number’s distance from zero, taking the absolute value of each endpoint and adding them together will give you the same results as using the formula.

Exercise 4 (10 minutes)

Exercise 4

Use the distance formula to find each answer. Support your answer using a number line diagram.

a. Find the distance between \( -7 \) and \( -4 \).

units

b. Find the change in temperature if the temperature rises from \( -18 \)°F to \( 15 \)°F (use a vertical number line).

\( -18 + 15 \)°F = 33°F

Scaffolding:

For parts (b)–(e), visual learners will benefit from using the number line to break down the distance into two sections, from zero to each given number.
Lesson 6: The Distance Between Two Rational Numbers

Lesson Summary
- To find the distance between two rational numbers on a number line, you can count the number of units between the numbers.
- Using a formula, the distance between rational numbers, and , is .
- Distance is always positive.
- Change may be positive or negative. For instance, there is a change when the temperature goes from to .

Closing (3 minutes)
- How can we use a number line to find the distance between two rational numbers?
  - We can count the number of units in between the two numbers.
- What does it mean to find the absolute value of a number?
  - You are finding the distance between that number and zero.
- Is it possible to use absolute value to find the distance between a number, , and another number, , that is not zero? If so, how?
  - Yes, instead of you would use ...
- Is distance always positive? Is change always positive?
  - Distance is always positive, but change can be positive or negative.

Exit Ticket (6 minutes)
Lesson 6: The Distance Between Two Rational Numbers

Exit Ticket

Two 7th grade students, Monique and Matt, both solved the following math problem:

If the temperature drops from $\text{ }^\circ\text{F}$ to $\text{ }^\circ\text{F}$, by how much did the temperature decrease?

The students came up with different answers. Monique said the answer is $\text{ }^\circ\text{F}$, and Matt said the answer is $\text{ }^\circ\text{F}$. Who is correct? Explain, and support your written response with the use of a formula and a vertical number line diagram.
Exit Ticket Sample Solutions

Two 2nd grade students, Monique and Matt, both solved the following math problem:

*If the temperature drops from °F to °F, by how much did the temperature decrease?*

The students came up with different answers. Monique said the answer is °F, and Matt said the answer is °F.

Who is correct? Explain, and support your written response with the use of a formula and number line diagram.

Monique is correct. If you use the distance formula, you take the absolute value of the difference between °F and °F and that equals °F. Using a number line diagram you can count the number of units between °F and °F to get °F. There was a °F drop in the temperature.

Problem Set Sample Solutions

1.  

2.  

3.  

4.  

5.  

6.  

7.  

8.  

9.  

10.  

11. Describe any patterns you see in the answers to the problems in the left and right-hand columns. Why do you think this pattern exists?

*Each problem in the right-hand column has the same answer as the problem across from it in the left-hand column. That is because you are finding the distance between the opposite numbers as compared to the first column. The difference between the opposite numbers is opposite the difference between the original numbers. The absolute values of opposite numbers are the same.*
