

Equivalent Fractions

Procedure:

1. Multiply both the numerator and the denominator by the same number.

Example:

Express $\frac{3}{4}$ as fortieths.

To turn fourths into fortieths, multiply the denominator by 10. So $4 \times 10 = 40$. This means the numerator must be multiplied by 10 also.

So $3 \times 10 = 30$. Therefore, $\frac{3}{4} = \frac{30}{40}$.
